Managing system roles

System roles make it easier to assign company resources that are frequently required or rather that are always assigned together. For example, new employees in the finance department should be provided, by default, with certain system entitlements for Active Directory and for SAP R/3. In order to avoid a lot of separate assignments, group these company resources into a package and assign this to the new employee. The packages are referred to as system role in One Identity Manager.

Using system roles, you can group together arbitrary company resources. You can assign these system roles to identities, workdesks, or roles or you can request them through the IT Shop. Identities and workdesks inherit company resources assigned to the system roles. You can structure system roles by assigning other system roles to them.

NOTE: The System Roles Module must be installed as a prerequisite for managing system roles in One Identity Manager. For more information about installing, see the *One Identity Manager Installation Guide*.

One Identity Manager components for managing system roles are available if the **QER | ESet** configuration parameter is set.

- In the Designer, check if the configuration parameter is set. Otherwise, set the configuration parameter and compile the database.

NOTE: If you disable the configuration parameter at a later date, model components and scripts that are no longer required, are disabled. SQL procedures and triggers are still carried out. For more information about the behavior of preprocessor relevant configuration parameters and conditional compiling, see the *One Identity Manager Configuration Guide*.

One Identity Manager users for managing system roles

The following users are used for setting up and administration of system roles.

Table 1: Users

User	Tasks
Responsible for individual company resources	<p>The users are defined using different application roles for administrators and managers.</p> <p>Users with these application roles:</p> <ul style="list-style-type: none">• Create and edit system roles.• Assign system roles to departments, cost centers, locations, business roles, or the IT Shop.• Assign system roles to identities.• Assign system roles to workdesks.
Product owners for the IT Shop	<p>Product owners must be assigned to the Request & Fulfillment IT Shop Product owners application role or a child application role.</p> <p>Users with this application role:</p> <ul style="list-style-type: none">• Approve through requests.• Edit service items and service categories under their management. <p>The Request & Fulfillment IT Shop Product owners System roles default application role can be used.</p>
One Identity Manager administrators	<p>One Identity Manager administrator and administrative system users Administrative system users are not added to application roles.</p> <p>One Identity Manager administrators:</p> <ul style="list-style-type: none">• Create customized permissions groups for application roles for role-based login to administration tools in the Designer as required.• Create system users and permissions groups for non role-based login to administration tools in the Designer as required.• Enable or disable additional configuration parameters in the Designer as required.• Create custom processes in the Designer as required.• Create and configure schedules as required.

Basics of calculating the inheritance of system roles

Any number of company resources and other system roles can be assigned to system roles. By assigning system roles to other system roles, you can structure system roles hierarchically. System roles can be assigned to identities and workdesks in the following ways:

- Direct assignment
- IT Shop request
- Inheritance through hierarchical roles
- Inheritance through dynamic roles

An identity (workdesk, hierarchical role) inherits all company resources that are assigned to the assigned system role. Child system roles are resolved in this case. Prerequisite is that each company resource can really be inherited.

NOTE: The identity must own a user account in this target system in order to inherit a target system entitlement.

Figure 1: Inheriting company resources through system roles

Objects assigned through inheritance are calculated by the DBQueue Processor. Tasks are added to the DBQueue when assignments relevant to inheritance are made. These tasks are processed by the DBQueue Processor and result in follow-on tasks for the DBQueue or

in processes for process component `HandleObjectComponent` in the Job queue. Resulting assignments of permissions to user accounts in the target system are inserted, modified, or deleted during process handling.

Detailed information about this topic

- [Details of system role inheritance](#) on page 8
- [Effectiveness of system roles](#) on page 9
- [Disabled system roles](#) on page 11
- [Example of a system role hierarchy](#) on page 28

Details of system role inheritance

The company resource assignments to system roles are mapped in the `ESetHasEntitlement` table.

The system role hierarchy is mapped through the `UID_ESet` - Entitlement relation. The system role hierarchy is stored in the `ESetCollection` table. All the system roles are listed that the given system role inherits from. Each role also inherits from itself.

The following relations apply in the `ESetCollection` table:

- `UID_ESet` is the system role that inherits.
- It inherits from the `UID_ESetChild` system role.

The `ESetHasEntitlement` table contains the direct assignment (`XOrigin = 1`) and all system roles that are assigned to the child system roles (`XOrigin = 2`). The company resources that are assigned to a child system role are not resolved until inheritance for identities, workdesks, and hierarchical roles is calculated.

Assignment of system roles to hierarchical roles are mapped in the `BaseTreeHasESet` table.

Identities can directly obtain system roles. Identities continue to inherit all (including inherited) the system roles belonging to all hierarchical roles of which they are members (table `PersonInBasetree`) as well as system roles of all hierarchical roles that are referenced through foreign key relations (`Person` table, `UID_BaseTree` column). Direct and indirect assignments of system roles to identities are mapped in the `PersonHasESet` table. This behavior applies in the same way to assignments of system roles to workdesks.

Detailed information about this topic

- [Examples of inheritance paths for system roles](#) on page 29

Effectiveness of system roles

By assigning system roles to identities, workdesks, or hierarchical roles, an identity may obtain company resources, which should not be assigned in this combination. To prevent this, you can declare mutually exclusive system roles. To do this you specify which system role of a pair of system roles, should be take effect if both are assigned. No company resources are inherited by the system role which is not effective.

Prerequisite

- The **QER | Structures | Inherit | ESetExclusion** configuration parameter is set.

In the Designer, set the configuration parameter and compile the database.

NOTE: If you disable the configuration parameter at a later date, model components and scripts that are no longer required, are disabled. SQL procedures and triggers are still carried out. For more information about the behavior of preprocessor relevant configuration parameters and conditional compiling, see the *One Identity Manager Configuration Guide*.

It is possible, to assign identities, workdesks, and company resources directly, indirectly, or by IT Shop request to an excluded system role. This can be done at any time.

One Identity Manager subsequently determines whether the assignment takes effect and the company resources are inherited.

NOTE:

- You cannot define a pair of mutually exclusive system roles. That means, the definition "System role A excludes System role B" AND "System role B excludes System role A" is not permitted.
- You must declare each system role to be excluded from a system role separately. Exclusion definitions cannot be inherited.

The effect of the assignments is mapped in the PersonHasESet, BaseTreeHasESet, and WorkdeskHasESet tables through the XIsInEffect column.

NOTE: If a company resource assigned to an excluded system role, is assigned directly or indirectly to an identity, or workdesk, the exclusion definition does not affect this company resource. The exclusion definition only applies to the system roles.

Example: Effectiveness of system roles

- The "Marketing" system role contains all the software applications and permissions for triggering requests.
- The "Finance" system role contains all the software applications and permissions for instructing payments.

- The "Controlling" system role contains all the software applications and permissions for verifying invoices.

Jo User1 directly assigns the system role "Marketing". They obtain the "Finance" system role and the "Controlling" system role through an IT Shop request. Jo User1 obtains all the system roles without an exclusion definition and therefore the associated permissions.

Take appropriate measures to prevent an employee who can instruct invoice payments from being able to initiate requests. That means, the "Finance" and "Marketing" are system roles mutually exclusive. An employee who audits invoices may not be able to make invoice payments as well. That means, the "Finance" and "Controlling" system roles are mutually exclusive.

Table 2: Specifying mutually exclusive system roles (table ESetExcludesESet)

Effective business role	Excluded System Role
Finance	Marketing
Controlling	Finance

Table 3: Effective assignments

Identity	Assigned system role	Effective business role
Pat Identity1	Marketing	Marketing
Jan User3	Marketing, finance	Finance
Jo User1	Marketing, finance, controlling	Controlling
Chris User2	Marketing, Controlling	Marketing, Controlling

Only the "Controlling" system role is in effect for Jo User1. If the "Controlling" system role is removed from Jo User1, the "Finance" system role assignment is reinstated.

Chris User2 retains the "Marketing" and "Controlling" system roles because there is no exclusion defined between the two system roles. That means that the identity is authorized to trigger request and to check invoices. If you want to prevent that as well, define further exclusion for the "Controlling" system role.

Table 4: Excluded system roles and effective assignments

Identity	Assigned system role	Excluded System Role (UID_ESetExcluded)	Effective business role
Chris User2	Marketing		Controlling
	Controlling	Finance Marketing	

Detailed information about this topic

- [Effect of exclusion definitions for system roles on page 31](#)
- [Special features of inheritance system roles through hierarchical roles on page 33](#)
- [Excluding system roles on page 24](#)

Disabled system roles

System roles can be disabled to temporarily to prevent, for example, identities and workdesks from inheriting their company resources. If a system role is disabled, the DBQueue Processor recalculates inheritance of its company resources. Existing assignments to identities and workdesks are removed. The disabled system role remains assigned however, the assignment no longer has any effect (`PersonHasESet.XIsInEffect = 0`). Once the system role is re-enabled, company resource inheritance is recalculated again. The company resources contained in the system role are assigned to identities and workdesks.

You cannot request a disabled system role in the Web Portal but you can assign a disabled system role directly to identities, workdesks, hierarchical roles, dynamic roles, and IT Shop shelves.

Creating and editing system roles

To create or edit a system role

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list. Select the **Change main data** task.
- OR -
Click  in the result list.
3. Edit the system role's main data.
4. Save the changes.

- [Excluding system roles](#) on page 24
- [Assigning extended properties to system roles](#) on page 25
- [Displaying the system role overview](#) on page 26
- [Configuration parameters for system roles](#) on page 27

General main data of system roles

Enter the following data for a system role.

Table 5: System role main data

Property	Description
Display name	Name for displaying the system roles in One Identity Manager tools.

Property	Description
System role	Unique identifier for the system role.
Internal product name	An additional internal name for the system role.
System role type	Specifies the type of company resources, which comprise the system role.
Service item	In order to use a service item within the IT Shop, assign a service item to it or add a new service item. For more information about service items, see the <i>One Identity Manager IT Shop Administration Guide</i> .
System role manager	<p>Manager responsible for the system role. Assign any identity. This identity can edit system role main data. They can be used as attestors for system role properties.</p> <p>If the system role can be requested in the IT Shop, the manager will automatically be a member of the application role for product owners assigned the service item.</p>
Share date	<p>Specify a date for enabling the system role. If the date is in the future, the system role is considered to be disabled. If the date is reached, the system role is enabled. Identities inherit company resources that are assigned to the system role.</p> <p>If the share date is exceeded or no date is entered, the system role is handled as an enabled system role. Company resource inheritance can be controlled with the Disabled option in these cases.</p> <p>NOTE: Configure and enable the Share system roles schedule in the Designer to check the share date. For more information about schedules, see the <i>One Identity Manager Operational Guide</i>.</p>
Risk index (calculated)	Maximum risk index values for all company resources. The property is only visible if the QER CalculateRiskIndex configuration parameter is enabled. For more information about calculating the risk index, see the <i>One Identity Manager Risk Assessment Administration Guide</i> .
Comment	Text field for additional explanation.
Remarks	Text field for additional explanation.
Description	Text field for additional explanation.
Deactivated	<p>Specifies whether identities and workdesks inherit the company resources contained in the system role.</p> <p>If this option is set, the system role can be assigned to identities, workdesks, hierarchical roles, and IT Shop shelves. However they cannot inherit the company resources contained in the system role. The system role cannot be requested in the Web Portal.</p>

Property	Description
	If this option is not set, company resources assigned to the system role are inherited. If the option is enabled at a later date, existing assignments are removed.
IT Shop	Specifies whether the system role can be requested through the IT Shop. The system role can be requested through the Web Portal and allocated by defined approval processes. The system role can still be assigned directly to identities and hierarchical roles. For more information about IT Shop, see the <i>One Identity Manager IT Shop Administration Guide</i> .
Only for use in IT Shop	Specifies whether the system role can only be requested through the IT Shop. The system role can be requested through the Web Portal and allocated by defined approval processes. The system role may not be assigned directly to hierarchical roles.
Spare field no. 01 ... Spare field no. 10	Additional company-specific information. Use the Designer to customize display names, formats, and templates for the input fields.

- [Disabled system roles](#) on page 11

Creating and editing system role types

System role types identify the type of company resources that the system role is used to grouped together. You can, for example, define system role types for system roles in which you group different target system groups.

To create or edit a system role type

1. In the Manager, select the **Entitlements > Basic configuration data > System role types** category.
2. Select a system role type in the result list. Select the **Change main data** task.
– OR –
Click  in the result list.
3. Enter a name and description for the system role type.
4. Save the changes.

Assigning company resources to system roles

Assign the company resources you want to group together into one package, to the system role. When you assign system roles to identities and workdesks, the company resources are inherited by the identities and workdesks.

NOTE: Company resources where the **Only use in IT Shop** option is set can only be assigned to system roles that also have this option set.

The following table lists the company resources you can assign to system roles.

NOTE: Company resources are defined in the One Identity Manager modules and are not available until the modules are installed.

Table 6: Possible company resource assignments

Company resource	Available in Module
Resources	always
Account definitions	Target System Base Module
Groups of custom target systems	Target System Base Module
System entitlements of custom target systems	Target System Base Module
Active Directory groups	Active Directory Module
SharePoint groups	SharePoint Module
SharePoint roles	SharePoint Module
LDAP groups	LDAP Module
Notes groups	Domino Module
SAP groups	SAP R/3 User Management Module
SAP profiles	SAP R/3 User Management Module
SAP roles	SAP R/3 User Management Module
SAP parameters	SAP R/3 User Management Module
Structural profiles	SAP R/3 Structural Profiles Add-on Module
BI analysis authorizations	SAP R/3 Analysis Authorizations Add-on Module
E-Business Suite permissions	Oracle E-Business Suite Module
Subscribable reports	Report Subscription Module
Software	Software Management Module
Azure Active Directory groups	Azure Active Directory Module
Azure Active Directory administrator roles	Azure Active Directory Module
Azure Active Directory subscriptions	Azure Active Directory Module
Disabled Azure Active Directory service plans	Azure Active Directory Module
Unix groups	Unix Based Target Systems Module
Cloud groups	Cloud Systems Management Module
Cloud system entitlements	Cloud Systems Management Module
PAM user groups	Privileged Account Governance Module

Company resource	Available in Module
Google Workspace groups	Google Workspace Module
Google Workspace products and SKUs	Google Workspace Module
SharePoint Online groups	SharePoint Online Module
SharePoint Online roles	SharePoint Online Module
OneLogin roles	OneLogin Module

To add company resources to a system role

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the task to assign the corresponding company resource.
4. In the **Add assignments** pane, assign company resources.

TIP: In the **Remove assignments** pane, you can remove company assignments.

To remove an assignment

- Select the company resource and double-click .
5. Save the changes.

Related topics

- [Assigning system roles](#) on page 24

Assigning system roles to workdesks and identities

You can assign system roles directly or indirectly to identities or workdesks. In the case of indirect assignment, identities (workdesks) and system roles are grouped into hierarchical roles. The number of system roles is calculated from the position in the hierarchy and the direction of inheritance assigned to an identity (or workdesk).

Add identities to a shop as customers so that system roles can be assigned through IT Shop requests. All system roles assigned as product to this shop can be requested by the customers. Requested system roles are assigned to the identities after approval is granted.

NOTE: If the system role is disabled or if the share date is still in the future, the company resources are not inherited.

Prerequisites for indirect assignment to identities

- Assignment of identities and system roles is permitted for role classes (departments, cost centers, locations, or business roles).

Prerequisite for indirect assignment to workdesks

- Assignment of workdesks and system roles is permitted for role classes (departments, cost centers, locations, or business roles).

To configure assignments to roles of a role class

1. In the Manager, select role classes in the **Organizations > Basic configuration data > Role classes** category.
- OR -
In the Manager, select role classes in the **Business roles > Basic configuration data > Role classes** category.
2. Select the **Configure role assignments** task and configure the permitted assignments.
 - To generally allow an assignment, enable the **Assignments allowed** column.
 - To allow direct assignment, enable the **Direct assignments permitted** column.
3. Save the changes.

NOTE: There are other configuration settings that play a role when company resources are inherited through departments, cost centers, locations, and business roles. For example, role inheritance might be blocked or inheritance of identities not allowed. For more detailed information about the basic principles for assigning company resources, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Assigning system roles to departments, cost centers, and locations

Assign the system role to departments, cost centers, and locations for it to be assigned to identities and workdesks through these organizations.

To assign a system role to departments, cost centers, and locations

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Assign organizations** task.
4. In the **Add assignments** pane, assign the organizations:
 - On the **Departments** tab, assign departments.
 - On the **Locations** tab, assign locations.
 - On the **Cost centers** tab, assign cost centers.

TIP: In the **Remove assignments** pane, you can remove assigned organizations.

To remove an assignment

- Select the organization and double-click .
5. Save the changes.

NOTE: In order for company resources assigned to the system role to be inherited by departments, cost centers, and locations, role classes must have the **Direct assignments allowed** option set. For more information about setting this option, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Adding system roles to the IT Shop

A system role can be requested by shop customers when it is assigned to an IT Shop shelf. There are other prerequisites to take into account so that a system role can be requested.

- The system role have the **IT Shop** option set.
- The system role must be assigned to a service item.
- If the system role can only be assigned to identities using IT Shop requests, the system role must be also labeled with **Only use in IT Shop**. Then, the system role may no longer be assigned directly to hierarchical roles.

To add a system role to the IT Shop

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select **Add to IT Shop**.
4. In the **Add assignments** pane, assign the system role to IT Shop shelves.
5. Save the changes.

To remove a system role from individual IT Shop shelves

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Add to IT Shop** task.
4. In the **Remove assignments** pane, remove the system role from the IT Shop shelves.
5. Save the changes.

To remove a system role from all IT Shop shelves

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Remove from all shelves (IT Shop)** task.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.

The system role is removed from all shelves by the One Identity Manager Service. All requests and assignment requests with this system role are canceled in the process.

For more information about the IT Shop, see the *One Identity Manager IT Shop Administration Guide*.

Assigning system roles directly to identities

System roles can be assigned directly or indirectly to identities. Indirect assignment is carried out by allocating the identity and system roles in company structures, like departments, cost centers, locations, or business roles.

To react quickly to special requests, you can assign system roles directly to identities. The identities obtain all company resources assigned to the system role.

NOTE: If the system role is disabled or if the share date is still in the future, the company resources are not inherited.

To assign a system role directly to identities

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Assign to identities** task.
4. In the **Add assignments** pane, add identities.

TIP: In the **Remove assignments** pane, you can remove assigned identities.

To remove an assignment

- Select the identity and double-click .
5. Save the changes.

Assigning system roles directly to workdesks

System roles can be assigned directly or indirectly to a contact. Indirect assignment is carried out by allocating the workdesk and system roles in company structures, like departments, cost centers, locations, or business roles.

To react quickly to special requests, you can assign system roles directly to workdesks. The workdesks obtain all company resources assigned to the system role.

NOTE: The company resources are not inherited if the system role is disabled or if the share date is still in the future.

To assign a system role directly to workdesks

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Assign workdesks** task.
4. In the **Add assignments** pane, assign workdesks.

TIP: In the **Remove assignments** pane, you can remove assigned workdesks.

To remove an assignment

- Select the workdesk and double-click .

5. Save the changes.

- [Assigning system roles directly to identities](#) on page 21

Adding system roles to system roles

Use this task to group different system roles into one package. This enables system roles to be structured from different view points.

NOTE: System roles with the **Only use in IT Shop** option set can only be assigned to system roles that also have this option set.

To assign a system role to system roles

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Assign system roles** task.
4. To assign parent system roles, select the **System Role contained in** tab.

- In the **Add assignments** pane, assign system roles.

TIP: In the **Remove assignments** pane, you can remove assigned system roles.

To remove an assignment

- Select the system role and double-click .

5. To assign child system roles, select the **System Role contains** tab.

- In the **Add assignments** pane, assign system roles.

TIP: In the **Remove assignments** pane, you can remove assigned system roles.

To remove an assignment

- Select the system role and double-click .

6. Save the changes.

Assigning system roles

By assigning system roles to other system roles, the system roles become structured hierarchically. A system role can be a child and a parent to any other system role.

In the inheritance calculation, child system roles are not treated as assigned company resources. The assignment of system roles to system roles is only used to build a hierarchy.

To structure system roles hierarchically

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Assign system roles** task.
4. Select the **System role contains** tab.
5. In the **Add assignments** pane, assign the system roles that you want to be children to the selected system role.

TIP: In the **Remove assignments** pane, you can remove assigned system roles.

To remove an assignment

- Select the system role and double-click ✓.
6. Select the **System role contained in** tab.
 7. In the **Add assignments** pane, assign the system roles that you want to be parents to the selected system role.

TIP: In the **Remove assignments** pane, you can remove the system role assignment.

To remove an assignment

- Select the system role and double-click ✓.
8. Save the changes.

Excluding system roles

Specify, which system role of a pair of system roles, should be take effect if both are assigned. No company resources are inherited by the system role which is not effective.

To exclude system roles

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Edit conflicting system roles** task.
4. In the **Add assignments** pane, assign system roles that are mutually exclusive to the selected system role.

TIP: In the **Remove assignments** pane, you can remove the system role assignment.

To remove an assignment

- Select the system role and double-click .
5. Save the changes.

Detailed information about this topic

- [Effectiveness of system roles](#) on page 9

Assigning extended properties to system roles

Extended properties are meta objects, such as operating codes, cost codes, or cost accounting areas that cannot be mapped directly in One Identity Manager.

To specify extended properties for a system role

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **Assign extended properties** task.
4. In the **Add assignments** pane, assign extended properties.

TIP: In the **Remove assignments** pane, you can remove assigned extended properties.

To remove an assignment

- Select the extended property and double-click .
5. Save the changes.

For more information about extended properties, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Displaying the system role overview

Use this task to obtain an overview of the most important information about a system role.

To obtain an overview of a system role

1. In the Manager, select the **Entitlements > System roles** category.
2. Select the system role in the result list.
3. Select the **System role overview** task.

Configuration parameters for system roles

The following configuration parameters are available in One Identity Manager after the module has been installed.

Table 7: Configuration parameters for the module

Configuration parameter	Description
QER ESet	<p>Preprocessor relevant configuration parameter for controlling the database model components for system roles. If this parameter is set, system components are available. Changes to this parameter require the database to be recompiled.</p> <p>If you disable the configuration parameter at a later date, model components and scripts that are no longer required, are disabled. SQL procedures and triggers are still carried out. For more information about the behavior of preprocessor relevant configuration parameters and conditional compiling, see the <i>One Identity Manager Configuration Guide</i>.</p>
QER Structures Inherit ESetExclusion	<p>Preprocessor-relevant configuration parameter for defining the effectiveness of system roles. If this parameter is set, mutually excluding system roles can be defined. Changes to this parameter require the database to be recompiled.</p> <p>If you disable the configuration parameter at a later date, model components and scripts that are no longer required, are disabled. SQL procedures and triggers are still carried out. For more information about the behavior of preprocessor relevant configuration parameters and conditional compiling, see the <i>One Identity Manager Configuration Guide</i>.</p>
QER Structures Inherit NoESetSplitting	<p>Specifies whether the components of a system role are already split in the hierarchical role (as previously) or not (current behavior). If this parameter is set, the system roles are not broken down into their individual components until the target of the inheritance.</p> <p>The configuration parameter does not affect child system roles.</p>

Appendix B

Examples of system role inheritance

The following example shows how inheritance of company resources through system roles works and what effect exclusion definitions have.

Example of a system role hierarchy

The following tables show how assignments to system roles and the system role hierarchy is mapped in the One Identity Manager database.

Table 8: System roles: assignments (ESetHasEntitlement)

System role (UID_ESet)	Assignment System Role (Entitlement)	Origin (XOrigin)
System role A	System role A1	1
System role A	System role A2	1
System role A	System role A11	2
System role A	System role A12	2
System role A1	System role A11	1
System role A1	System role A12	1
System role A1	System entitlement	1
System role A2	Software	1
System role A11	Active Directory group	1
System role A12	SAP role	1
System role B	Resource	1

Table 9: System role hierarchy (table ESetCollection)

System role (UID_ESet)	Child System Role (UID_ESetChild)
System role A	System role A
System role A	System role A1
System role A	System role A2
System role A	System role A11
System role A	System role A12
System role A1	System role A1
System role A1	System role A11
System role A1	System role A12
System role A11	System role A11
System role A12	System role A12
System role A2	System role A2
System role B	System role B

Examples of inheritance paths for system roles

Figure 2: Inheriting an Active Directory group through a directly assigned system role

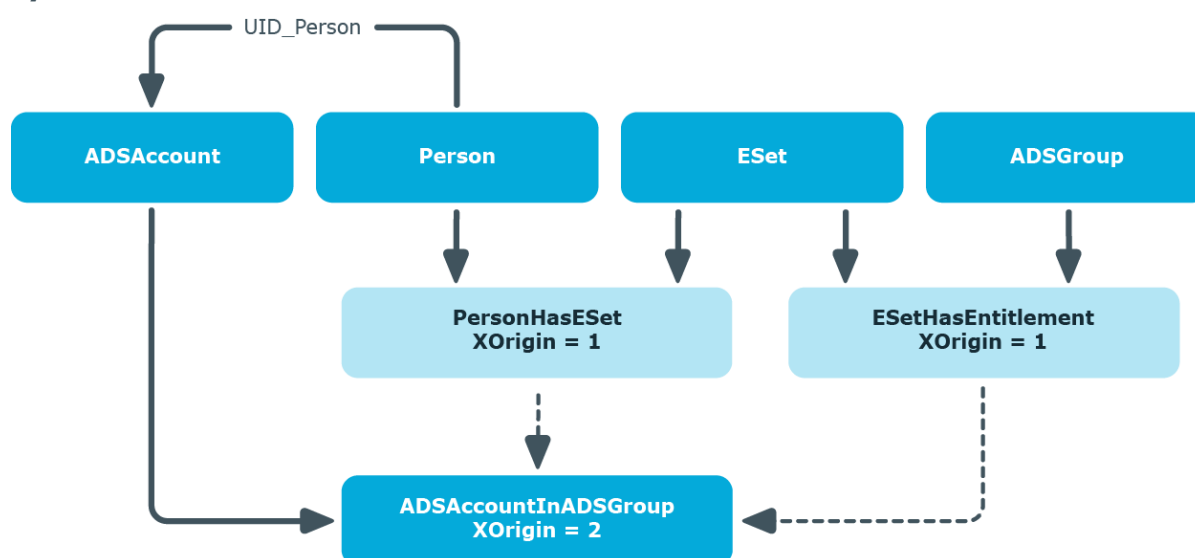

Figure 3: Inheriting software through an IT Shop request

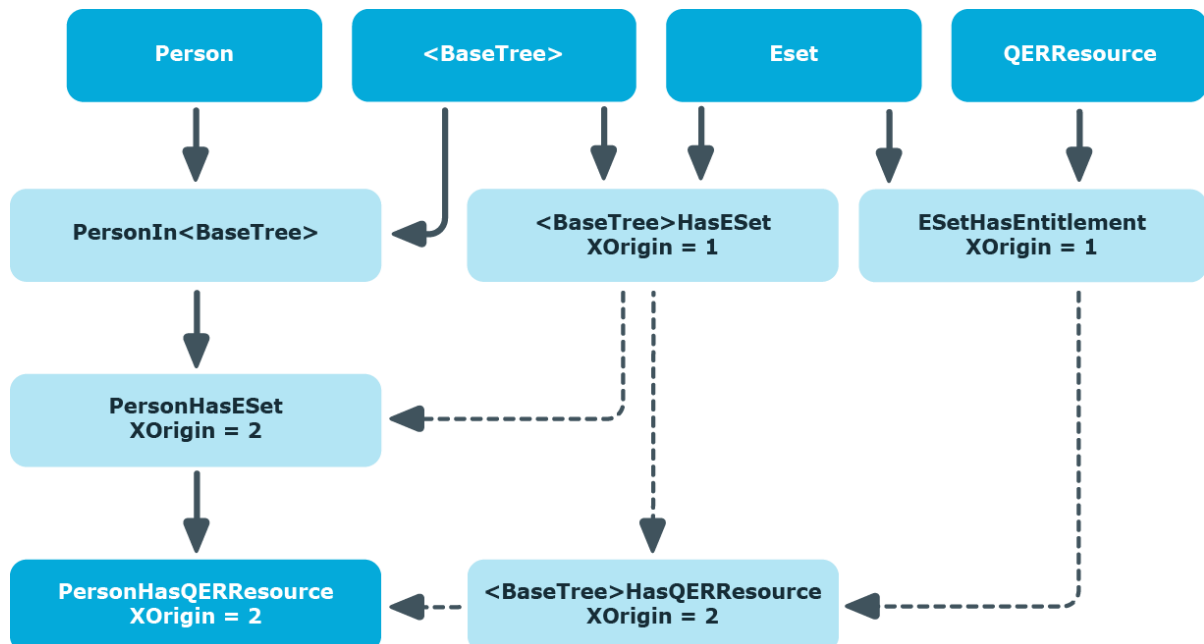

Figure 4: Inheriting a resource through an indirectly assigned system role

Effect of exclusion definitions for system roles

The following images show how excluding a system role affects how inheritance is calculated. Excluded system roles can still be assigned to identities. An option on the column `XIsInEffect` defines whether this assignment applies. Assigning an excluded system role leads to the entry `XIsInEffect = 0`, if the other system role from the exclusion definition is assigned at the same time.

Table 10: Excluded system roles (table `ESetExcludesESet`)

System role (UID_ESet)	Excluded System Role (UID_ESetExcluded)
System role A12	System role A11
System role B	System role B1
System role B	System role A2

Table 11: System roles: inheritance (table `ESetHasEntitlement`)

System role (UID_ESet)	Assignment System Role (Entitlement)	Assignment Applies (XIsInEffect)
System role A	System role A1	1
System role A	System role A2	1
System role A	System role A11	0
System role A	System role A12	1
System role A1	System role A11	0
System role A1	System role A12	1
System role A2	Software	1
System role A11	Active Directory group	1
System role A12	SAP role	1
System role B	Resource R1	1
System role B1	Resource R2	1

Figure 5: Inheritance through directly assigned system roles

Figure 6: Inheritance through an IT Shop request

Special features of inheritance system roles through hierarchical roles

Table 12: Configuration parameters for calculating assignments to hierarchical roles

Configuration parameter	Effect when set
QER Structures Inherit NoESetSplitting	Specifies whether or not the components of a system role are already split in the hierarchical role. If this parameter is set, the system roles are not broken down into their individual components until the target of the inheritance.

If this configuration parameter is set, system roles that are assigned to hierarchical roles are not split in the calculation of inheritance. This means that the assignments of company resources to hierarchical roles are not written to the corresponding assignment tables (<BaseTree>Has...). The system roles whose assignments are in effect (PersonHasESet.XIsInEffect = 1) are not split until the calculation of user inheritance.

NOTE: A system role hierarchy is always split. This means the assignment of child system roles to hierarchical roles is always written in the assignment tables. This behavior is independent of the configuration parameter setting.

This configuration parameter is set by default.

Figure 7: Inheritance by indirectly assigned system roles when the configuration parameter is set

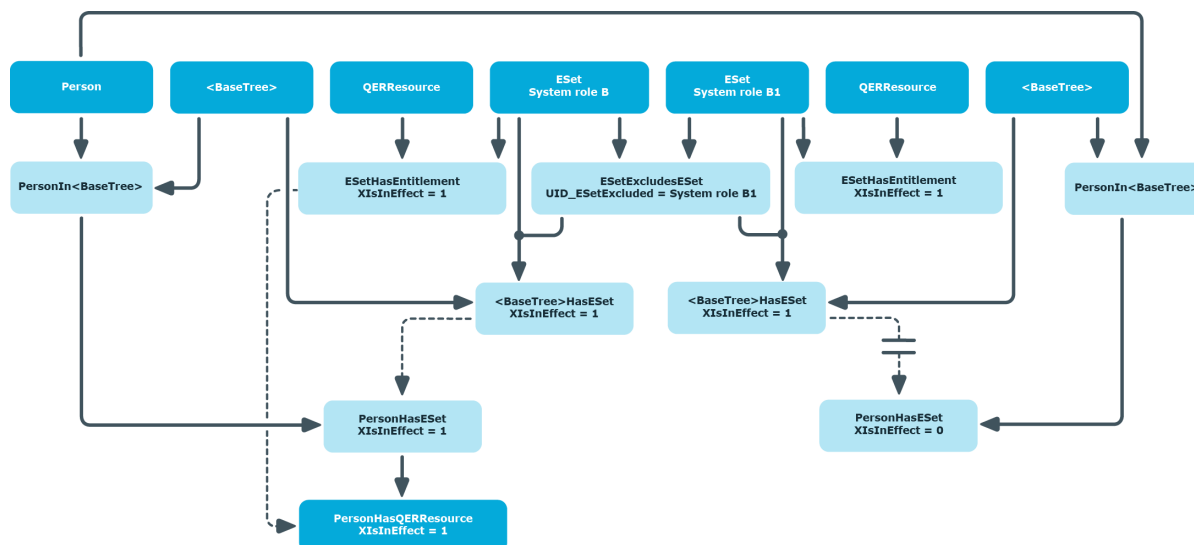

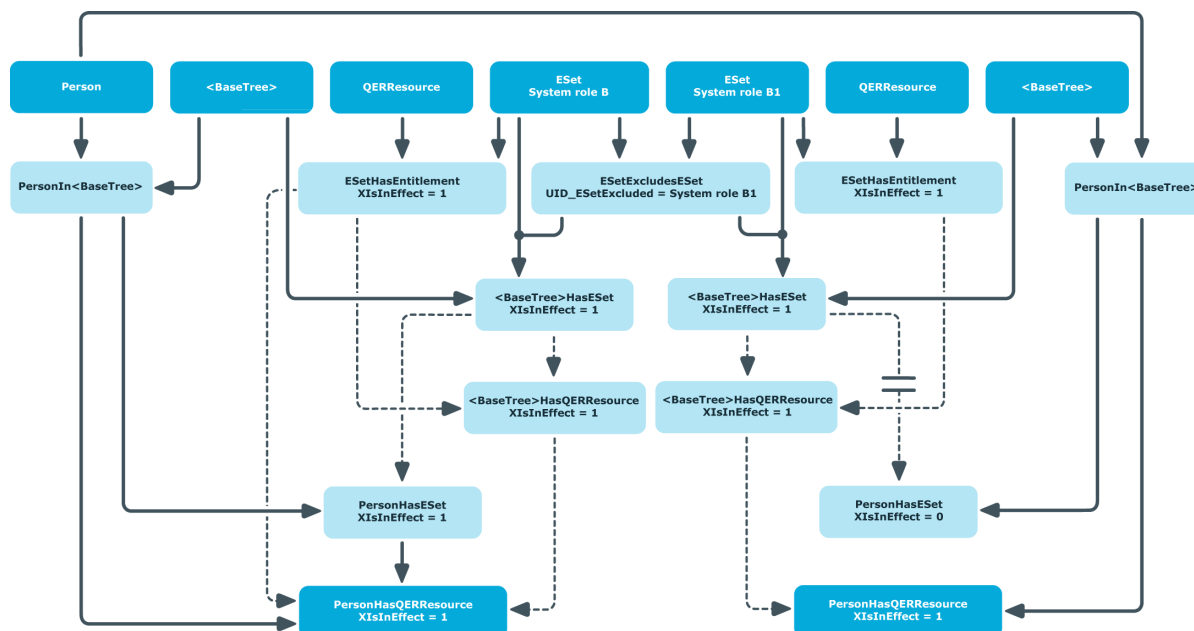

Figure 8: Inheritance by different hierarchical roles when the configuration parameter is set

If the configuration parameter is not set, the system roles whose assignments are in effect (BaseTreeHasESet.XIsIneffect = 1) are split in the inheritance calculation for the hierarchical roles. If the excluding system roles are assigned to different hierarchical roles, both assignments are effective. This makes the resulting company resource assignments to hierarchical roles also effective. If an identity is a member of both hierarchical roles, the company resources of the excluded system role are inherited by this identity.

Figure 9: Inheritance by different hierarchical roles when the configuration parameter is not set

If the mutually exclusive system roles are assigned to the same hierarchical role, the exclusion definition takes effect when calculating BaseTreeHasESet.

Figure 10: Inheritance through the same hierarchical role when the configuration parameter is not set

One Identity solutions eliminate the complexities and time-consuming processes often required to govern identities, manage privileged accounts and control access. Our solutions enhance business agility while addressing your IAM challenges with on-premises, cloud and hybrid environments.

For sales and other inquiries, such as licensing, support, and renewals, visit <https://www.oneidentity.com/company/contact-us.aspx>.

Technical support resources

Technical support is available to One Identity customers with a valid maintenance contract and customers who have trial versions. You can access the Support Portal at <https://support.oneidentity.com/>.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to videos at www.YouTube.com/OneIdentity
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
